Corporate website: headless CMS

Frontend Developer · 06.2026 – 10.2026

Rebuild of a company's public website. WordPress serves as the content backend, a Next.js application renders the site, and pages update automatically when editors publish.

- Built 10+ service landing pages on Next.js 15 (App Router), React 19 and Tailwind CSS 4.
- Created 20+ reusable page sections: FAQ blocks with SEO markup, tabs, case cards and blog listings, with responsive and mobile layouts.
- Set up tag-based incremental static regeneration, triggered by WordPress webhooks when a post or a navigation menu is updated.
- Fixed a production issue where menu requests returned HTML error pages from the CDN and broke JSON parsing. Added content-type checks and retries with backoff.
- Developed custom Gutenberg blocks with ACF, including a case-study block with a metrics table.
- Connected contact and subscription forms using Cloudflare Turnstile verification and Nodemailer.
- Fixed a Docker build that hung at the lint and typecheck stages of the CI pipeline, noticeably reducing build time.

Stack: TypeScript, Next.js, React, Tailwind CSS, Radix UI, Framer Motion, WordPress (headless, ACF, Gutenberg), PHP, Nodemailer, Cloudflare Turnstile, Docker, Bitbucket Pipelines.

HR tech: AI-assisted candidate evaluation

Full Stack Developer · 02.2026 – 09.2026

A system that analyses interview transcripts and candidate CVs, scores candidates against client requirements and posts the resulting report back into the hiring workflow. Over the project it processed 100+ vacancies and candidates.

- Main developer of the product: built the Fastify API, the background workers and the React frontend.
- Implemented the analysis pipeline: PDF CV parsing, extraction of work history, consistency checks between the CV and the interview, and LLM scoring against client requirements. A full analysis is generated in 30–60 seconds.
- Added a RAG pipeline on Qdrant with OpenAI embeddings to find similar past candidates, so each evaluation is based on historical hiring data.
- Integrated Linear through its SDK and webhooks: analysis starts when a ticket receives new data, and the report is posted back as a comment.
- Moved long LLM calls out of the request cycle into BullMQ and Redis, with three separate workers for analysis, CV consistency and interview preparation.
- Built the API with JWT authentication, rate limiting and file upload, validating all endpoints with shared Zod schemas.
- Developed the frontend with TanStack Router, Query and Table, shadcn/ui, Recharts dashboards and a Tiptap editor for editing reports.
- Set up PostgreSQL (Prisma), Qdrant and Redis in Docker Compose, deployed the frontend on Render and exposed the backend through a Cloudflare Tunnel.

Stack: TypeScript, Node.js, Fastify, Prisma, BullMQ, Zod, OpenAI API, Qdrant, PostgreSQL, Redis, React, Vite, TanStack, Tailwind CSS, shadcn/ui, Docker, Render, Cloudflare.

Productivity software: desktop meeting recorder with AI search

Frontend Developer · 07.2026 – 09.2026

A local-first desktop application for recording meetings and asking questions about them in natural language. Answers cite sources, and each citation plays back the exact moment in the recording.

- Built the main screens: meeting page, transcript tab, interaction statistics, audio player with waveform and meeting export.
- Implemented the settings area (privacy, notifications, personal mentions, profile and password change) and the first-run setup wizard.
- Worked with a local RAG store on SQLite and sqlite-vec that combines full-text and vector search over transcripts.
- Managed state with Zustand, localized the app into English and Russian with react-i18next, and covered transcript utilities with unit tests.

Stack: TypeScript, React, Vite, Tauri, Zustand, Radix UI, React Hook Form, react-i18next, SQLite, sqlite- vec.

E-commerce SaaS: tools for 3D-printing sellers

Full Stack Developer · 04.2026 – 07.2026

A subscription platform for 3D-printing sellers: parametric model configurators that run in the browser, plus AI-assisted marketplace listings and product mockups.

- Built five 3D model configurators with real-time preview on Three.js and React Three Fiber, assembling printable models from a library of 350+ STL parts. Each configurator includes text handling (fonts, spacing), drag-and-drop in the viewer and processing of the 3D mesh.
- Moved CSG geometry operations into Web Workers using manifold-3d (WebAssembly) so the interface stays responsive during mesh generation. Configured the Next.js build for async WebAssembly.
- Wrote client-side geometry utilities: text-to-cross-section generation from TTF fonts, a binary STL parser and multi-part 3MF assembly.
- Developed NestJS endpoints for server-side model assembly, using a Piscina worker-thread pool for heavy operations and S3 for storing results.
- Replaced fragile filename parsing with a dedicated part-resolver service, which removed a class of silent 404 errors across 350+ assets.
- Integrated OpenAI behind provider interfaces for marketplace listings and mockup generation. A listing with an image is generated in about 30 seconds, and the tools I implemented have handled 1,000+ generations in total.
- Built the landing and pricing pages.

Stack: TypeScript, Next.js, React, Three.js, React Three Fiber, WebAssembly, Web Workers, NestJS, Prisma, PostgreSQL, AWS (Cognito, S3, CloudFront), OpenAI API, Stripe, PayPal, Docker.
